

Creating issues is great for team projects and collaborating with others especially when working in local repositories, along with pull requests and merging branches. When you create an issue, you are essentially posting to a board that something in the project needs to be changed or fixed, assigning someone to that problem, and adding a sort of documentation to it to identify the kind of problem it is. You can also include due dates on your issues. Pull requests happen when you push your work from your local repository, extracting the changes made and allowing you to compare them to see if you should merge the branches.
